Lab-5

Finish the implementation of **class Math**.

What to add.

1) Static function **isPrime(int)** that returns true if the specified value is prime number.

   A prime number is greater than 1 and divisible only by 1 and itself. Check whether n is divisible by any integer from 2 up to n/2. If any divisor is found, return false. Otherwise, return true. Numbers less than 2 are not prime.

2) Static function **int power(int a, int b)** that returns the result of $(a)^b$.

   Assume that b is a non-negative integer. Use a loop to multiply a by itself b times. Remember that any number raised to the power of 0 equals 1.

3) Static function **parseInt(const string&)** that converts a string to an int value.

```
std::string s("123a");
Math::parseInt(s);  //should return an integer 123
```

   Hint: std::stoi

How to run.

1) Open console and run the following commands:
   a. Command to compile class Math

```
g++ -c Math.cpp
```

   b. If there are no errors, you can see the Math.o file with ls command.
   c. Command to link to object codes and create an output file.

```
g++ Math.o test.o
```

   d. Run the output file and get the access code.

```
./a.out
```

   e. Get Quiz 3 access code.

Submission.

Once your program works correctly and the output format is correct, submit your work using the following Git commands:

```
git add <file_name>
git commit -m "Commit message"
git push
```
